OPERATION & MAINTENANCE MANUAL

DFI No. D00160
Facility Type: Water Quality Vault

JUNE, 2011

INDEX

1. Identification

Drainage Facility ID (DFI):	**D00160**
Facility Type:	Water Quality Vault
Construction Drawings:	(V-File Number) 27V-026
Location:	District: 2B
	Highway No.: 141
	Mile Post: 6.87
	Description: Access to this facility can be obtained from Hall Blvd. - Beaverton-Tigard Hwy. (Hwy 141) at the intersection of Hall and SW Omara St.

2. Facility Contact Information

Contact the Engineer of Record, Region Technical Center, or Geo-Environmental's Senior Hydraulics Engineer for:

- Operational clarification
- Maintenance clarification
- Repair or restoration assistance

Engineering Contacts:

Region Technical Center Hydro Unit Manager

Or

Geo-Environmental Senior Hydraulics Engineer (503) 986-3365.

3. Construction

Engineer of Record:	ODOT Designer - Region 1 Tech. Center, Thomas Lulay, P.E. (Mngr.), 503-731-8200
Facility construction:	1996
Contractor:	N/A/

4. Storm Drain System and Facility Overview

This water quality vault is an underground media filter facility designed to treat stormwater runoff. The system is a proprietary product manufactured in 1996 by an earlier subsidiary of Contech Construction Products, Inc. The underground media filter type facility is an earlier prototype of the current Stormwater Management StormFilter Treatment System. Treatment is provided by filtration through a compost media filter. This facility contains an Operational and Maintenance manual as prepared by the manufacturer and is provided in Appendix C.

This model for this facility is a 12'x6' 'Drop-in' compost stormwater filter. It is basically a 12-ft by 6-ft concrete vault with a layer of compost media, wrapped in filter fabric, placed along the bottom.

The facility is located at the intersection of Hall Blvd and SW Omara St. within the center median (See Photo 1). Access to the facility can be obtained from Hall Blvd and will require traffic management precautions. The drainage area for the facility includes Hall Blvd from the intersection of SW Omara to approximately 1,000 feet south. The stormwater runoff is collected by a series of inlets and conveyed by a 12-inch storm pipe located on the south side of Hall Blvd. A pollution control manhole is located approximately 400 feet south of the facility where the stormwater is pretreated, prior to its being discharged into the facility via the 12-inch conveyance line. The facility is considered an online facility. After treatment through the media filter vault the stormwater continues flowing north.

Both the media filter facility and the pollution control manholes were constructed in 1996. Based on the as-built data and maintenance information, it is questionable whether these facilities are properly treating the stormwater. Future retrofit may be required of these facilities.

A. Maintenance equipment access:
   This facility is a 12-foot by 6-foot vault accessible by three manhole lids and rims. Access to the facility can easily be obtained by Hall Blvd.

B. Heavy equipment access into facility:

   ☐ Allowed (no limitations)
   ☒ Allowed (with limitations); traffic control required.
   ☐ Not allowed

C. Special Features:

   ☐ Amended Soils
   ☐ Porous Pavers

☐ Liners
☐ Underdrains

Photo 1: Looking north, this photo depicts the manhole lids of the water quality vault at the intersection of Hall Blvd and SW Omara St.

Photo 2: Looking south along Hall Blvd from the facility. This photo shows the drainage basin contributing to the facility.

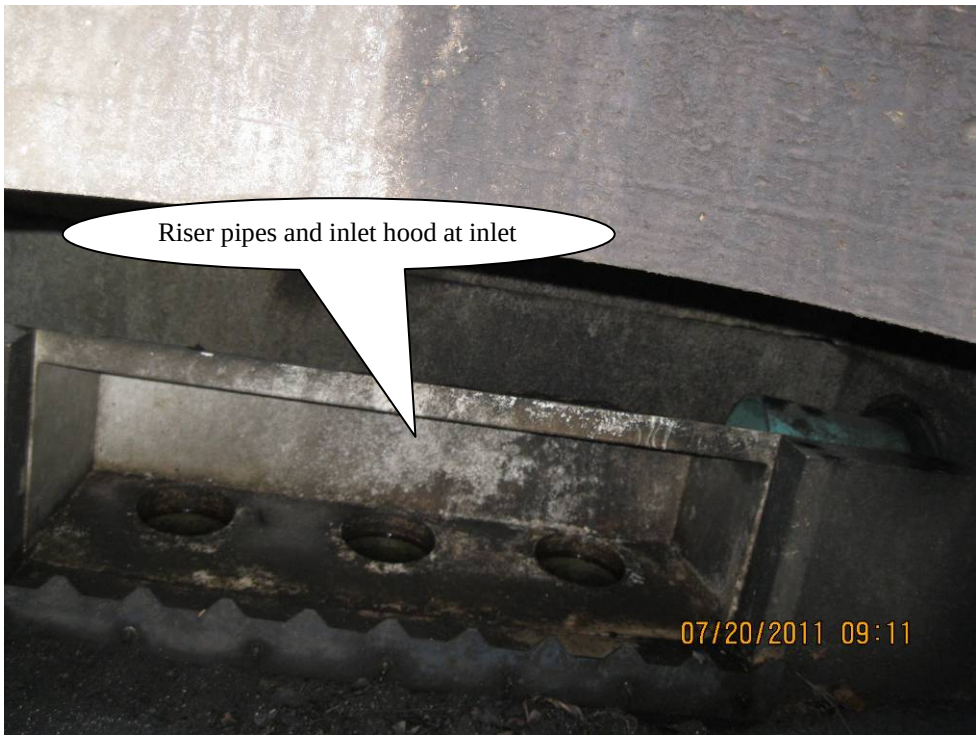

Photo 3: Internal view of water quality vault at the inlet; Point B Operational Plans.

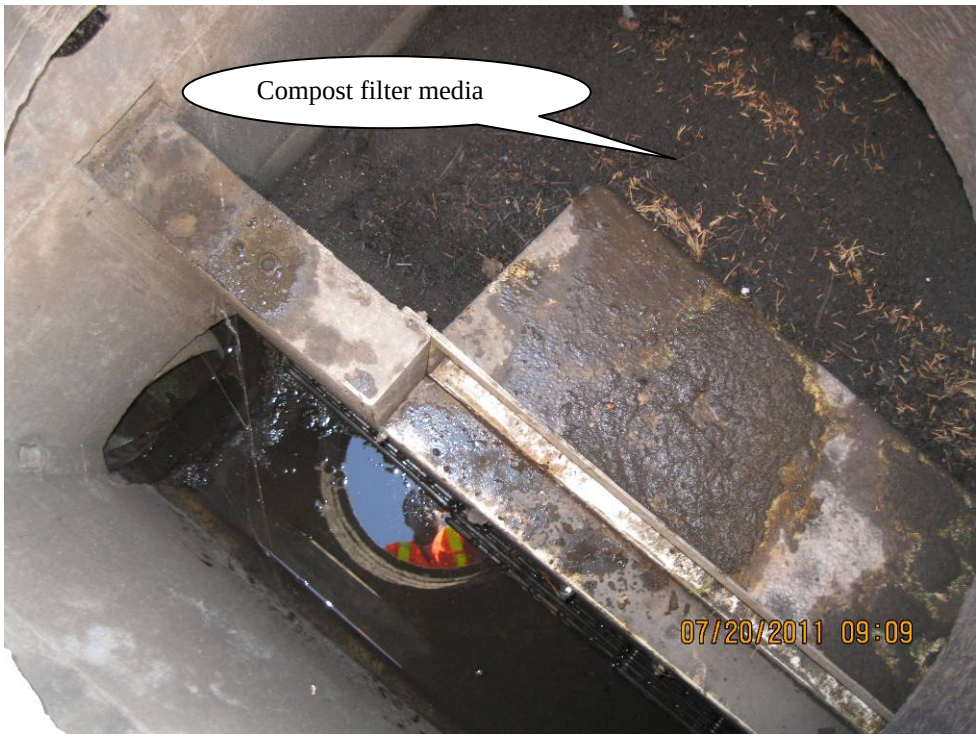

Photo 4: Internal view of water quality vault at the backside of the outlet; Point C Operational Plans.

5. Facility Haz Mat Spill Feature(s)

This water quality vault is not ideal for storing a volume of liquid in case of a hazardous spill. It may be more feasible to consider blocking the 12-inch diameter outlet pipe located at the pollution control manhole upstream of the water quality vault facility. See the Pollution Control Manhole, Point A on the Operational Plan, Appendix A.

6. Auxiliary Outlet

Auxiliary Outlets are provided if the primary outlet control structure can not safely pass the projected high flows. Broad-crested spillway weirs and over flow risers are the two most common auxiliary outlets used in stormwater treatment facility design. The auxiliary outlet feature is either a part of the facility or an additional storm drain feature/structure.

The auxiliary outlet feature for this facility is:

☒ Designed into facility
High flows bypass the treatment features and exit the treatment zone of the media filter by overtopping an interior high flow bypass weir wall.

☐ Other, as noted below

7. Maintenance Requirements

Routine maintenance table for non-proprietary stormwater treatment and storage/detention facilities have been incorporated into ODOT's Maintenance Guide. These tables summarize the maintenance requirements for ponds, swales, filter strips, bioslopes, and detention tanks and vaults. Special maintenance requirements in addition to the routine requirements are noted below when applicable.

The ODOT Maintenance Guide can be viewed at the following website:

http://www.oregon.gov/ODOT/HWY/OOM/MGuide.shtml

Maintenance requirements for proprietary structures, such as underground water quality manholes and/or vaults with filter media are noted in Appendix C when applicable.

The following stormwater facility maintenance table (See ODOT Maintenance Guide) should be used to maintain the facility outlined in this Operation and Maintenance Manual or follow the Maintenance requirements outlined in Appendix C when proprietary structure is selected below:

☒ Table 1 (general maintenance)
☐ Table 2 (stormwater ponds)
☐ Table 3 (water quality biofiltration swales)
☐ Table 4 (water quality filter strips)
☐ Table 5 (water quality bioslopes)
☐ Table 6 (detention tank)
☐ Table 7 (detention vault)
☐ Appendix C (proprietary structure)
☒ Special Maintenance requirements:

Maintenance Component	Defect or Problem	Conditions When Maintenance Is Needed	Recommended Maintenance to Correct Problem
Media Filter	Sediment Loading	Facility has trapped sufficient sediment and debris that system is utilizing overflow	Remove sediment and debris
	Channeling, rutting, or lacking media filter material	Media Filter contains obvious channeling, rutting, or lacking adequate depth	Apply additional media filter and energy dissipaters to system

Note: Special maintenance Requirements Require Concurrence from ODOT SR Hydraulics Engineer.

8. Waste Material Handling

Material removed from the facility is defined as waste by DEQ. Refer to the roadwaste section of the ODOT Maintenance Yard Environmental Management System (EMS) Policy and Procedures Manual for disposal options: http://egov.oregon.gov/ODOT/HWY/OOM/EMS.shtml

Contact any of the following for more detailed information about management of waste materials found on site:
