OPERATION & MAINTENANCE MANUAL

DFI No.: D00174
Facility Type: Detention Tank/Pipe

JULY, 2011

INDEX

1. Identification

Drainage Facility ID (DFI):	**D00174**
Facility Type:	Detention Tank/Pipe
Construction Drawings:	(V-File Number) 37V-041
Location:	District: 2B (Old 2A)
	Highway No.: 047
	Mile Post: 65.83/65.87 (beg./end)
	Description: This facility is located north of the westbound lanes of US26 (Hwy 047) between Bethany Boulevard and Cornell Road. Access to the facility can be obtained from the unobstructed shoulder of westbound US26 (Hwy 047).

2. Facility Contact Information

Contact the Engineer of Record, Region Technical Center, or Geo-Environmental's Senior Hydraulics Engineer for:

- Operational clarification
- Maintenance clarification
- Repair or restoration assistance

Engineering Contacts:

Region Technical Center Hydro Unit Manager

Or

Geo-Environmental Senior Hydraulics Engineer (503) 986-3365.

3. Construction

Engineer of Record:	ODOT Designer – Region 1 Tech. Center, Bruce S. Council, P.E., (503) 731-8319
Facility Construction:	2004
Contractor:	Mowat Construction Company

4. Storm Drain System and Facility Overview

A detention facility is designed to control the quantity of runoff, by reducing the peak discharge and only detaining runoff for some short period of time. These facilities are designed to store and gradually release or attenuate stormwater runoff via a control structure or release mechanism, and completely drain after the design storm has passed. The most common detention facilities include:

- Dry ponds - these are depressed storage areas that store runoff during wet weather and are dry the rest of the time. Usually they are earthen depressions.
- Tanks - these are underground storage facilities that are typically constructed from large diameter pipe.
- Vaults - these are enclosed underground storage facilities. They are typically constructed from reinforced concrete.

This detention facility is located north of the westbound lanes of US26 (Hwy 047) between Cornell Road and Bethany Boulevard. Access to the facility may be obtained from the unobstructed shoulder off these lanes.

This detention facility consists of 197 feet of 48-inch diameter pipe and three manholes, each 8 feet in diameter. The facility's total length is 221 feet.

This detention facility receives treated water from the adjacent water quality biofiltration swale (DFI D00171) at three inlets near the center of the swale (Points A, B, C on Operational Plan in Appendix A). Water is directed from the easternmost and westernmost inlets (Points A, B), via 18-inch diameter pipes, to the central inlet (Point C). From the central inlet, another 18-inch pipe conveys water to the central manhole of the detention facility (Point D). The water is then detained in the detention facility's pipes and manholes.

The westernmost manhole contains the flow control device, which detains flow (Point E). The flow control device consists of a flow restricting orifice and an overflow weir wall. After detention, flow exits through the orifice, and a 24-inch diameter storm pipe conveys the runoff to a manhole (Point F). From there, the water is discharged into a 24-inch diameter storm pipe, which conveys the water northwards.

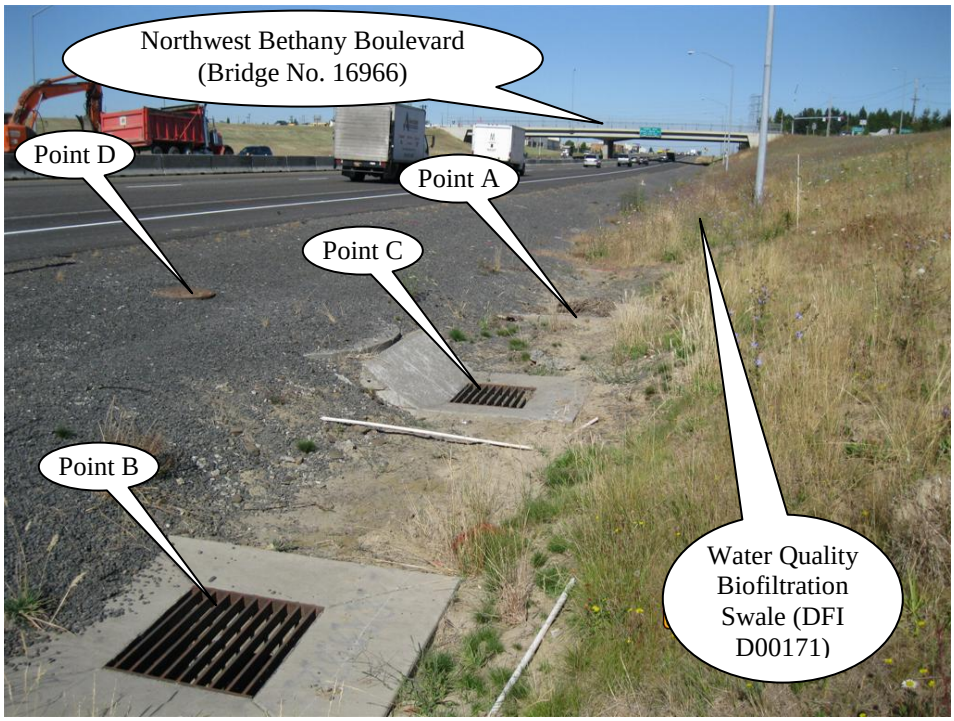

Photo 1: The central manhole of the detention facility (**Point D**) is adjacent to the inlets associated with a nearby water quality swale (DFI D00171) (**Points A, B, C**). Photo taken facing west.

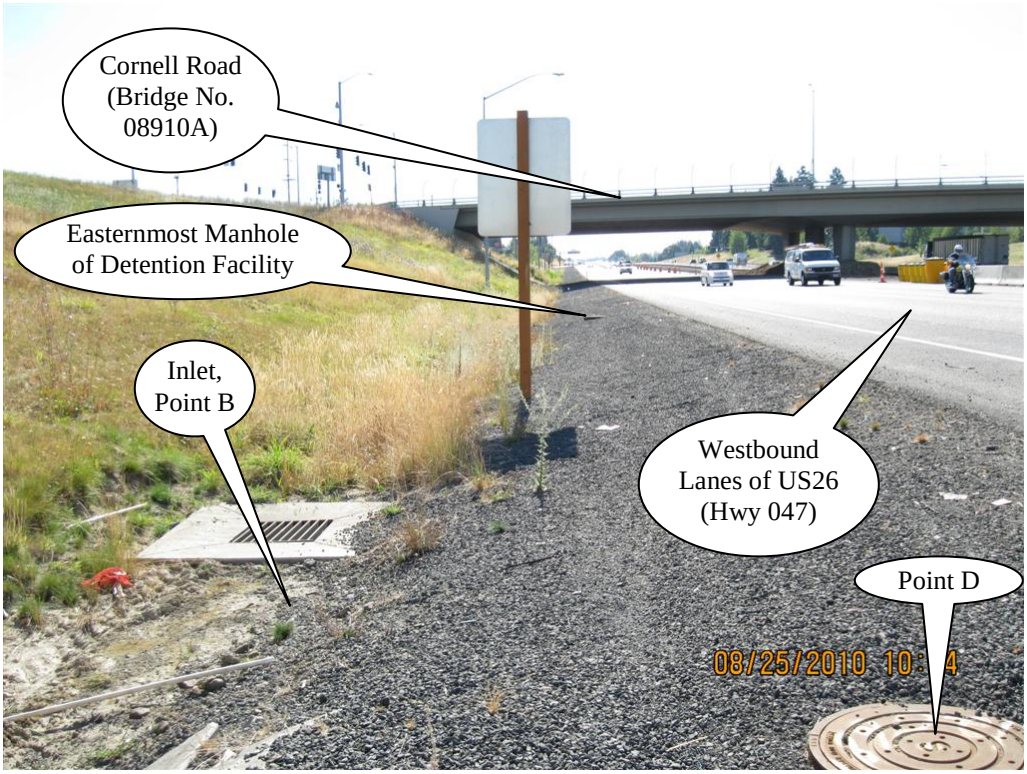

Photo 2: The central manhole of this detention facility is shown in foreground (**Point D**). The easternmost manhole of the detention facility is shown in the background. Westbound lanes of US 26 (Hwy 47) are on the right. Photo taken facing east.

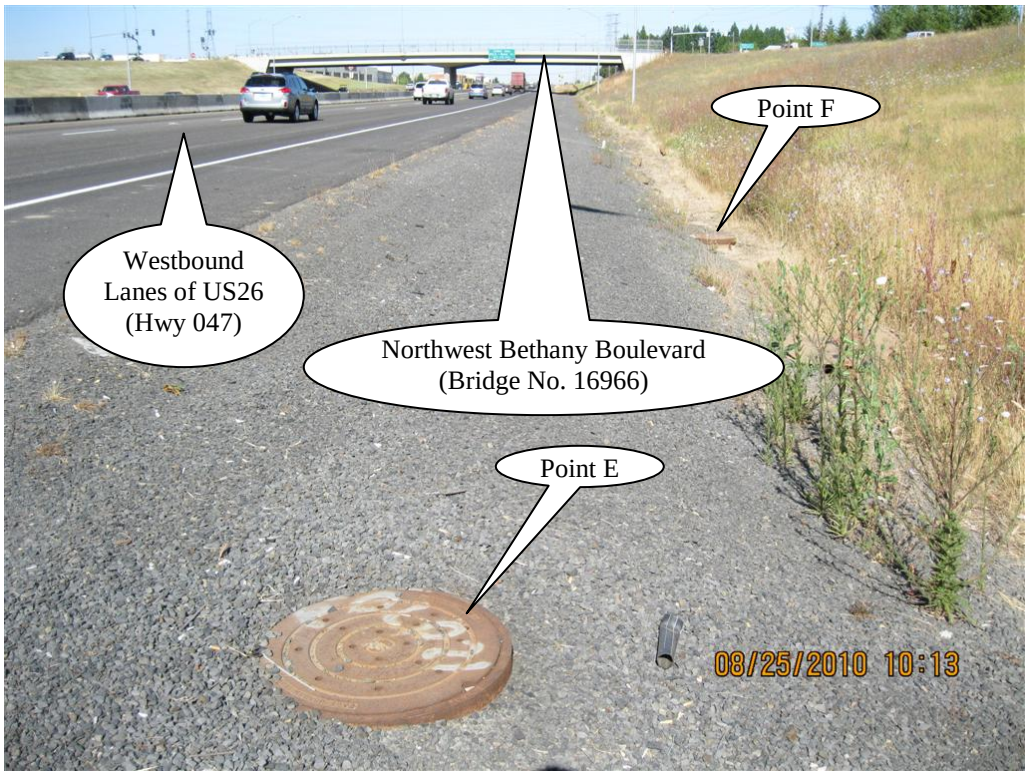

Photo 3: The westernmost manhole for the detention facility contains the flow control device (**Point E**). After detention the water is directed by a 24-inch storm pipe to a manhole (**Point F**). Photo taken facing west.

For further information and details regarding the system refer to Appendix A for the Operational Plan and Appendix B for the Construction Project Plan sheets.

A. Maintenance equipment access:
   The facility can be accessed for maintenance from the unobstructed shoulder of US26 (Hwy 047) westbound.

B. Heavy equipment access into facility:

   ☒ Allowed (no limitations)
   ☐ Allowed (with limitations)
   ☐ Not allowed

C. Special Features:

   ☐ Amended Soils
   ☐ Porous Pavers
   ☐ Liners
   ☐ Underdrains

5. Facility Haz Mat Spill Feature(s)

This facility is not suitable for capturing hazardous materials.

However, action to contain hazardous materials may be taken at the inlets of the adjacent water quality biofiltration swale (DFI D00171) (Points A, B, C). If these inlets at the middle of the swale are blocked, the swale can effectively store a volume of liquid. Metal plates or sandbags can be used to block these inlets.

6. Auxiliary Outlet (High Flow Bypass)

Auxiliary Outlets are provided if the primary outlet control structure cannot safely pass the projected high flows. Broad-crested spillway weirs and overflow risers are the two most common auxiliary outlets used in stormwater treatment facility design. The auxiliary outlet feature is either a part of the facility or an additional storm drain feature/structure.

The auxiliary outlet feature for this facility is:

☒ Designed into facility - An overflow weir wall is located in the westernmost manhole of the detention facility (Point E). If the restricting orifice becomes plugged or if flows exceed the anticipated high flow, excess water overtops the weir wall and exits the detention facility through the outlet pipe.

☐Other, as noted –

7. Maintenance Requirements

Routine maintenance table for non-proprietary stormwater treatment and storage/detention facilities have been incorporated into ODOT's Maintenance Guide. These tables summarize the maintenance requirements for ponds, swales, filter strips, bioslopes, and detention tanks and vaults. Special maintenance requirements in addition to the routine requirements are noted below when applicable.

The ODOT Maintenance Guide can be viewed at the following website:

http://www.oregon.gov/ODOT/HWY/OOM/MGuide.shtml

Maintenance requirements for proprietary structures, such as underground water quality manholes and/or vaults with filter media are noted in Appendix C when applicable.

The following stormwater facility maintenance table (See ODOT Maintenance Guide) should be used to maintain the facility outlined in this Operation and Maintenance Manual or follow the Maintenance requirements outlined in Appendix C when proprietary structure is selected below:

- ☒ Table 1 (general maintenance)
- ☐ Table 2 (stormwater ponds)
- ☐ Table 3 (water quality or biofiltration swales)
- ☐ Table 4 (water quality filter strips)
- ☐ Table 5 (water quality bioslopes)
- ☒ Table 6 (detention tank)
- ☐ Table 7 (detention vault)
- ☐ Appendix C (proprietary structure)
- ☐ Special Maintenance requirements: None

Note: Special maintenance Requirements Require Concurrence from ODOT SR Hydraulics Engineer.

8. Waste Material Handling

Material removed from the facility is defined as waste by DEQ. Refer to the roadwaste section of the ODOT Maintenance Yard Environmental Management System (EMS) Policy and Procedures Manual for disposal options: http://egov.oregon.gov/ODOT/HWY/OOM/EMS.shtml

Contact any of the following for more detailed information about management of waste materials found on site:

ODOT Clean Water Unit	(503) 986-3008
ODOT Statewide Hazmat Coordinator	(503) 229-5129
ODOT Region Hazmat Coordinator	(503) 731-8304
