1. Identification

Drainage Facility ID (DFI): D00345

Facility Type: Water Quality Biofiltration Swale

Construction Drawings: (V-File Number) 41V-041

Location: District: 2C

Highway No.: 002

Mile Post: 45.00; 45.05 (beg./end)

Description: This facility is located on the north side of US30, I-84 (Hwy 002) just east of Cascade Locks, Oregon between the off ramp (Exit 44) and the main roadway, leading into town. A maintenance access

pad is available from the off-ramp.

2. Facility Contact Information

Contact the Engineer of Record, Region Technical Center, or Geo-Environmental's Senior Hydraulics Engineer for:

- Operational clarification
- Maintenance clarification
- Repair or restoration assistance

Engineering Contacts:

Region Technical Center Hydro Unit Manager

Or

Geo-Environmental Senior Hydraulics Engineer (503) 986-3365.

3. Construction

Engineer of Record: Consultant Designer – URS, Inc., Dale Cerney,

P.E., (503) 222-7200

Facility construction: 2008

Contractor: Wildish Standard Paving Company.

4. Storm Drain System and Facility Overview

A water quality swale is a flat-bottomed open channel designed to treat stormwater runoff from highway pavement areas. This type of facility is lined with grass. Treatment by trapping sedimentation occurs when stormwater runoff flows through the grass.

This facility is located on the north side of US30, I-84 (Hwy 002) just east of Cascade Locks, Oregon between the off ramp (Exit 44) and the main roadway, leading into town. A maintenance access pad is available from the off-ramp.

Stormwater runoff is collected by catch-basin inlets and 12-inch pipes along both the east and westbound segments of I-84 (Hwy 002) and led toward a downward sloping rock-lined channel (the facility inlet); see Point A of the Operational Plan, Appendix A. Once in the swale, the water quality flows meander overtop a series of rock-lined flow spreaders and a grass-lined channel before reaching the facility outlet near where "Wa-na-Pa" Street (an extension of the US30 Frontage Road) and the off-ramp intersect. Stormwater exits the facility at the swale's outlet (Point B of the Operational Plan) and enters a ditch where flows are conveyed toward Dry Creek – a local creek, flowing around the eastern and northern sides of the site.

A. Maintenance equipment access:

Maintenance personnel should find a maintenance access pad directly available from the left side of the off-ramp after leaving westbound I-84 (Hwy 002) at exit 44, heading into Cascade Locks, Oregon.

B.	Heavy equipment access into facility:
	☑ Allowed (no limitations)☐ Allowed (with limitations)☐ Not allowed
C.	Special Features:
	☐ Amended Soils☐ Porous Pavers☐ Liners☐ Underdrains

Photo 3: Water quality facility outlet looking east. Off-ramp is located to the left.

Photo 4: Water quality facility outfall to ditch looking east. Off-ramp located to the left.

- 4 -

Photo 5: Water quality facility outfall to ditch looking south toward I-84.

5. Facility Haz Mat Spill Feature(s)

It is not likely that this water quality biofiltration swale can be used to store a volume of liquid in the event of a hazardous spill event. However, it may be possible to use sandbags by blocking the flow of contaminated stormwater near the outlet of the swale; see Point B on the Operational Plan, Appendix A.

6. Auxiliary Outlet (High Flow Bypass)

Auxiliary Outlets are provided if the primary outlet control structure can not safely pass the projected high flows. Broad-crested spillway weirs and over flow risers are the two most common auxiliary outlets used in stormwater treatment facility design. The auxiliary outlet feature is either a part of the facility or an additional storm drain feature/structure.

The auxiliary outlet feature for this facility is:

□ Designed into facility

This facility does not have an auxiliary high flow bypass available.

7. Maintenance Requirements

Routine maintenance table for non-proprietary stormwater treatment and storage/detention facilities have been incorporated into ODOT's Maintenance Guide. These tables summarize the maintenance requirements for ponds, swales, filter strips, bioslopes, and detention tanks and vaults. Special maintenance requirements in addition to the routine requirements are noted below when applicable.

The ODOT Maintenance Guide can be viewed at the following website:

http://www.oregon.gov/ODOT/HWY/OOM/MGuide.shtml

Maintenance requirements for proprietary structures, such as underground water quality manholes and/or vaults with filter media are noted in Appendix C when applicable.

The following stormwater facility maintenance table (See ODOT Maintenance Guide) should be used to maintain the facility outlined in this Operation and Maintenance Manual or follow the Maintenance requirements outlined in Appendix C when proprietary structure is selected below:

□ Table 1 (general maintenance)
☐ Table 2 (stormwater ponds)
□ Table 3 (water quality biofiltration swales)
☐ Table 4 (water quality filter strips)
☐ Table 5 (water quality bioslopes)
☐ Table 6 (detention tank)
☐ Table 7 (detention vault)
☐ Appendix C (proprietary structure)
☐ Special Maintenance requirements:
Note: Special maintenance Requirements Require Concurrence from
ODOT SR Hydraulics Engineer.

8. Waste Material Handling

Material removed from the facility is defined as waste by DEQ. Refer to the roadwaste section of the ODOT Maintenance Yard Environmental Management System (EMS) Policy and Procedures Manual for disposal options: http://egov.oregon.gov/ODOT/HWY/OOM/EMS.shtml

Contact any of the following for more detailed information about management of waste materials found on site:

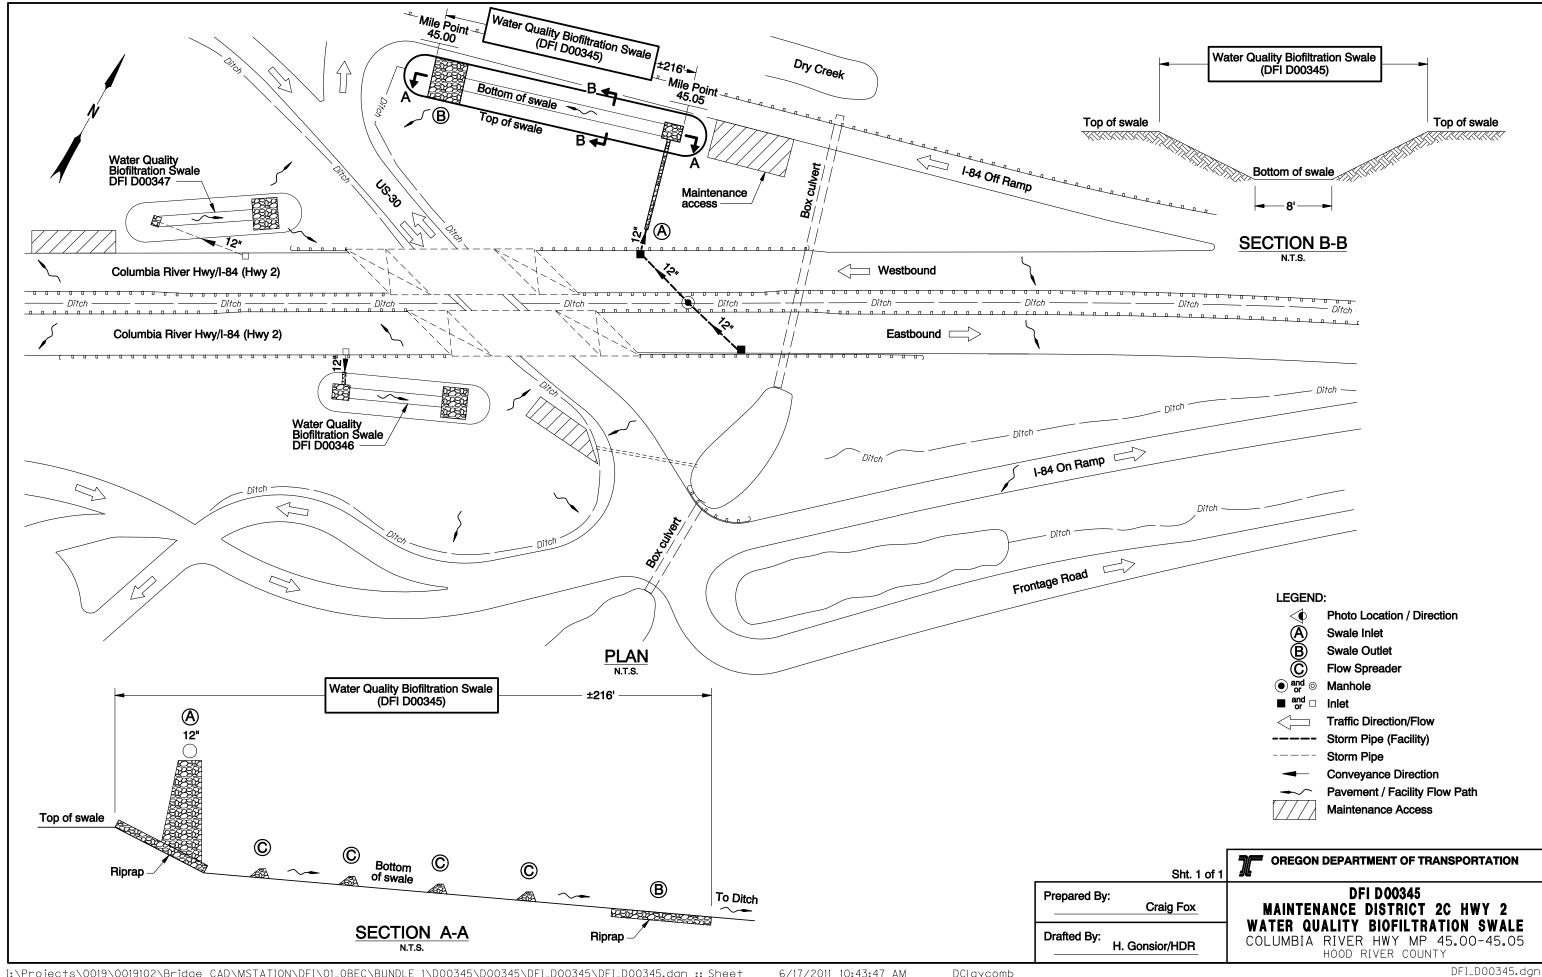

ODOT Clean Water Unit (503) 986-3008

ODOT Statewide Hazmat Coordinator	(503) 229-5129
ODOT Region Hazmat Coordinator	(503) 731-8304
