COVID-19 Weekly Report

Oregon's Weekly Surveillance Summary

Background

COVID-19 Weekly Report data will be finalized every Sunday at 11 p.m. PST, and the report will be published on Wednesday. Please note that the data reported here are continually being updated. For daily up-to-date information, visit the OHA COVID-19 web page: <https://govstatus.egov.com/OR-OHA-COVID-19>.

As of 11 p.m. Sunday, November 7, there have been 374,251 cases of COVID-19 reported to the Oregon Health Authority. Of these, 12,589 (3.4%) are “presumptive” cases—i.e., people with COVID-19-like symptoms and close contact with a confirmed case, but who did not have a confirmatory laboratory test. Though not confirmed, presumptive cases are highly likely to have COVID-19, given their specific symptoms and known exposure. Presumptive cases are encouraged to seek testing to confirm that they do have COVID-19. Presumptive cases who test positive are recategorized as confirmed cases.

These data represent a snapshot of COVID-19 risk factors and clinical and demographic characteristics of cases, and they include data on cases with pending investigations. Not all cases have been interviewed at the time of this report. The data shown in this report come from Oregon’s electronic disease surveillance system for reportable diseases.

During the week of October 31–November 6¹ 135,539 tests for COVID-19 were performed on Oregonians; of these, 6.4% had a positive result.² This figure represents a “test-based” method, whereby all electronic lab reports received by OHA are used to calculate percent positivity.³ Detailed tables of the number of tests and percent positivity can be found online at

<https://public.tableau.com/profile/oregon.health.authority.covid.19#!/vizhome/OregonHealthAuthorityCOVID-19DataDashboard/OregonsCOVID-19ELRsbyCounty>.

¹ This date range aligns with CDC’s “MMWR week.”

² Does not include antibody (serology) tests.

³ www.cdc.gov/coronavirus/2019-ncov/lab/resources/calculating-percent-positivity.html

COVID-19 Weekly Report

Oregon's Weekly Surveillance Summary

Weekly Report Summary

During Monday, November 1, through Sunday, November 7, 2021, OHA recorded 6,643 new cases of COVID-19 infection—down 16% from the previous week's total, and the fewest since the last week of July. The decrease occurred despite a 4% increase in testing, with test positivity falling from 7.4% to 6.4%. The overall incidence of reported COVID-19 in Oregon was 146 per 100,000 this week, but varied by county vaccination rate: it was 98 per 100,000 collectively in the 5 counties with vaccination rates $\geq 70\%$, 152 per 100,000 in the 7 counties with vaccination rates 60%–69%, 200 per 100,000 in the 13 counties with vaccination rates 50%–59%, and 215 per 100,000 in the 11 counties with population vaccination rates $< 50\%$. Through September 5, 6.2% of reported cases had been in children < 10 years of age; since September 5, 11.3% of cases have been reported from this age cohort.

Newly reported COVID-19-associated hospitalizations rose from 313 last week to 378 this week. The recent increase in the proportion of reported cases among persons < 10 years of age has not been accompanied by a commensurate increase in COVID-19-associated hospitalizations: 1.2% of hospitalizations were reported in persons this age group before September 5 and 1.4% since that date.

Two hundred forty-three COVID-19-associated deaths were reported last week—the highest weekly figure of the pandemic. This reflects in part ongoing efforts to address a backlog of suspected COVID-19-associated deaths identified by matching death certificate records to previously reported cases of COVID-19. Of the 374,251 cases reported in Oregon to date, 19,943 (5.3%) have been hospitalized, and 4,620 (1.2%) have died. To date, 3,111 (67%) of COVID-19-associated deaths have been among persons ≥ 70 years of age, and 5 (0.1%) have been among persons < 20 years of age. Data on mortality in Oregon, including deaths associated with COVID-19, are available at <https://public.tableau.com/profile/oha.center.for.health.statistics>.

Additional data are available at

<https://public.tableau.com/profile/oregon.health.authority.covid.19#!/vizhome/OregonCOVID-19CaseDemographicsandDiseaseSeverityStatewide/DemographicData>.

COVID-19 Weekly Report

Oregon's Weekly Surveillance Summary

Clinical Characteristics and risk factors

This section of the report describes the epidemiology of Oregon's COVID-19 cases, including indicators of COVID-19 transmission, common symptoms experienced by COVID-19 cases, and demographic breakdowns for sex, age, race, and ethnicity. Indicators of disease severity, specifically hospitalizations and deaths, are included in the tables.

Epidemiologic links

The figures below show the epidemiologic link of COVID-19 cases. Public health classifies all cases as part of a household, part of an outbreak, part of a cluster, a close contact of another case, or sporadic. Sporadic indicates that a case was not linked to a known source of COVID-19. Lower numbers of sporadic cases suggest lower community spread of COVID-19. Figure 1 focuses on recent cases of COVID-19, and allows for the easy comparison of different types of epidemiologic link. Figure 2 includes all COVID-19 cases, showing the pattern of epidemiologic links since the first cases were identified in Oregon. Figures 3 and 4 show sporadic cases by race, and figures 5 and 6 show sporadic cases by ethnicity. Looking at the data by race and ethnicity helps public health to identify disparities.

Epidemiologic link designations:

- Sporadic:⁴ Cases who do not have known exposure to another case or outbreak.
- Outbreak: Cases who have a shared, defined exposure with at least one other case. For example, a defined exposure could be an event, a workplace, a congregate facility, etc.
- Cluster: Cases who had contact with another case, but the exposure is not well defined. For example, cases from two households who interacted many times prior to illness onset.
- Household: Cases who were exposed to another case in their household.

⁴ Due to the lag between case reporting and case investigation, the proportion of cases categorized as sporadic is high in the most recent week or more; some of these cases will be recategorized after investigation is completed.

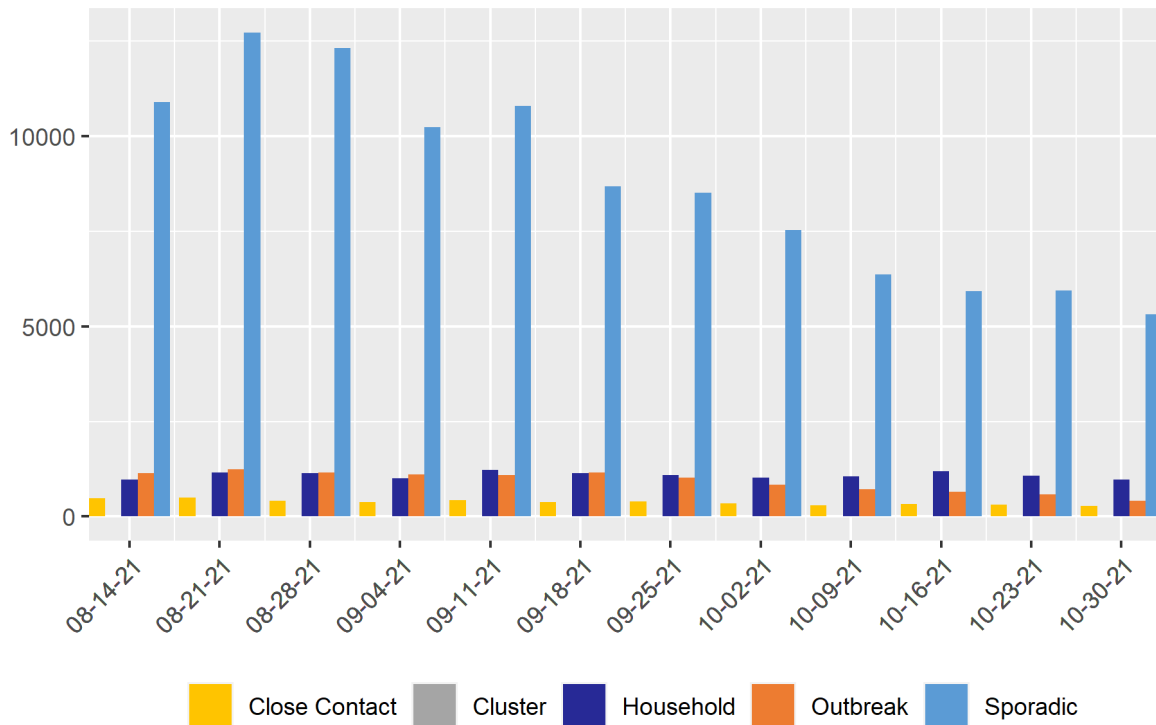

COVID-19 Weekly Report

Oregon's Weekly Surveillance Summary

- Close contact: Cases who were exposed to another case, not in their household. This designation was added on 7/15/2020.

Figure 6. All sporadic COVID-19 cases by ethnicity and week of onset

Clinical symptoms and reported risk factors

Figure 7 provides information on signs and symptoms from all COVID-19 cases. Of 374,251 cases, 193,316 (51.7%) reported having signs and symptoms of COVID-19. The most commonly reported symptoms are cough (n=107,436, 28.7%) and headache (n=86,024, 23%). Figure 8 provides information on the percentage of COVID-19 cases that report symptoms over time. Figure 9 provides information on risk factors from all COVID-19 cases. The most common risk factors are having contact with a known COVID-19 case prior to symptom onset (n=151,364, 40.4%) and having underlying medical conditions (n=234,734, 62.7%). Note that a person may report more than one sign/symptom or risk factor. Where displayed by week in this report, case data are categorized by week of reported symptom onset, not by date of case report. This results in reduced numbers in the most recent week or more due to reporting lags.

Figure 8. Reported symptoms among all COVID-19 cases by week of onset

COVID-19 Weekly Report

Oregon's Weekly Surveillance Summary

Figure 9. Reported risk factors among all COVID-19 cases

Risk factor definitions:

- Congregate living situations include, but are not limited to, long-term care facilities, group homes, prisons, and shelters. Data include people with confirmed cases who live or work in congregate living situations.
- Direct patient care is only asked if a case is a healthcare worker or volunteer. The denominator is the number of healthcare workers or volunteers.
- Underlying medical conditions include cardiovascular disease, chronic liver disease, chronic lung disease, chronic renal disease, current or former smoker, diabetes mellitus, immunocompromised condition, neurologic and neurodevelopmental conditions, obesity, or other chronic diseases.

Demographics

The following tables and figures show the demographic characteristics for all COVID-19 cases. The tables show case counts, case rates, and indicators of severity by sex, age,

COVID-19 Weekly Report

Oregon's Weekly Surveillance Summary

race and ethnicity. The figures show cases over time, by week of onset, for sex, age, race, and ethnicity. Figure 10 displays case rates by county, in comparison to the case rate for all of Oregon.

Geography

The following figure shows case rates by county for the most recently completed MMWR week, which is currently October 31 to November 6, 2021. Cases are displayed using the date that the case became known to public health.

Figure 10. Case rates per 100,000 population, by county

COVID-19 Weekly Report

Oregon's Weekly Surveillance Summary

1. Counties that had case rates above the case rate for the state are displayed in orange. Counties that had case rates below the case rate for the state are displayed in blue.
2. Counties that had zero cases in the time period displayed appear on the list, but do not have a bar to display.

Sex

Table 1. Severity and rates of COVID-19 by sex

Sex	Cases	% of total cases	Cases per 100,000	Hospitalized	% Hospitalized	Deaths	Case fatality
Female	188,923	50.5	8,734.6	9,346	4.9	2,070	1.1
Male	178,303	47.6	8,469.9	10,443	5.9	2,525	1.4

Age-adjustment

Tables 5 and 6 show the ratio of age-adjusted rates of COVID-19 for cases, hospitalizations, and deaths by race and ethnicity. Each table compares the rates of cases, hospitalizations, and deaths between each group and a reference group and accounts for differences in population distributions in each group.

Table 5. Ratio of age-adjusted rates for cases, hospitalizations, and deaths by race

Age-adjusted rate ratios of cases, hospitalizations, and deaths, compared to white persons.

Race	Cases	Hospitalizations	Deaths
> 1 race	0.5	0.8	1.2
American Indian/Alaska Native	2.2	2.9	3.0
Asian	0.8	0.9	0.9
Black	1.8	3.1	2.2
Pacific Islander	2.2	5.7	5.4
White	1.0	1.0	1.0

1. During the case investigation, people are asked to self-report their race, ethnicity, tribal affiliation, country of origin, or ancestry.
2. U.S. Census Bureau; American Community Survey, 2019 American Community Survey 5-Year Estimates.
3. Persons for which race information was not available were not included in these estimates. The number of persons with race data unavailable can be found in Table 3.

COVID-19 Weekly Report

Oregon's Weekly Surveillance Summary

Table 6. Ratio of age-adjusted rates for cases, hospitalizations, and deaths by ethnicity

Age-adjusted rate ratios of cases, hospitalizations, and deaths, compared to non-Hispanic.

Ethnicity	Cases	Hospitalizations	Deaths
Hispanic	2	2.6	2.3
Non-Hispanic	1	1.0	1.0

1. During the case investigation, people are asked to self-report their race, ethnicity, tribal affiliation, country of origin, or ancestry.
2. U.S. Census Bureau; American Community Survey, 2019 American Community Survey 5-Year Estimates.
3. Persons for which ethnicity information was not available were not included in these estimates. The number of persons with ethnicity data unavailable can be found in Table 4.

Follow-up

Figure 22 shows the percentage of cases that were called within 24 hours of being reported to public health by race. Figure 23 shows the percentage of cases that were called within 24 hours of being reported to public health by ethnicity. Figure 24 shows the percentage of cases that were interviewed, by race. Figure 25 shows the percentage of cases that were interviewed, by ethnicity. Race and ethnicity data are collected when cases are interviewed. Race and ethnicity data for cases that were not interviewed are abstracted from laboratory reports and medical records if it is available. The orange line in figures 22 and 23 represents the state metric for timely follow up for all cases: 95%.

Oregon's Weekly Surveillance Summary

Recovery

OHA staff periodically call people with reported COVID-19 who experienced fever, cough, shortness of breath or diarrhea and were initially interviewed before May 1, 2020, when OHA changed its definition of recovery, to inquire about resolution of symptoms. This group includes 1,884 people who were all diagnosed before mid-April and have not succumbed to their illness. Among these, 1,682 (88.8%) are considered to have recovered, and a recovery date is available for 1,387 people; their time to recovery is depicted in Figure 26. Of these 1,884 people, 16 (0.8%), have not yet recovered; and recovery status is not available for 186 (9.8%). People are assumed to have recovered three days after resolution of all symptoms. The median time to recovery among non-hospitalized symptomatic cases is 20 days (interquartile range: 15–29 days); among symptomatic cases who were hospitalized it is 26 days (interquartile range: 18–37 days).

Figure 26. Time to recovery among symptomatic people with COVID-19

Notes about recovery data:

- Recovery definition: three days after reported resolution of diarrhea, cough, shortness of breath and fever.
- Inclusion criteria: cases who were interviewed about their date of recovery before a change in recovery definition on May 1, 2020.
- Data for 1,387 cases are included.

COVID-19 Weekly Report

Oregon's Weekly Surveillance Summary

- This was last updated on September 16, 2020; Data will be updated again as new information is available.

People with Intellectual and Developmental Disabilities

As of September 26, 2021 OHA is aware of 1,407 people with intellectual or developmental disabilities who have had COVID-19 to date. This includes individuals who live in congregate settings and in family or individual homes. To date, there are 41 deaths among people with intellectual or developmental disabilities. This number is from conducting a match between the ODHS Office of Developmental Disabilities Services client list and the Oregon COVID-19 case database. OHA will update this number on a quarterly basis.

Additional information about the ODDS program and COVID-19 can be found here: <https://www.oregon.gov/dhs/SENIORS-DISABILITIES/DD/ODDS%20Resource%20Library/ODDS-Residential-COVID-19-Report.pdf>.

ODDS data is based on self-reports from providers and case management entities and therefore may differ from testing data received from the Oregon Health Authority.

Weekly COVID-19 Hospitalizations (HOSCAP)

OHA is publishing data on the number of COVID-19 hospitalizations by hospital in the prior week; data are from HOSCAP. Table 7 lists all hospitals which, at some time during the week reported, had 10 or more COVID-19 patients. The left column shows the highest number of COVID-19 hospitalized patients for each hospital between 11/01/2021 and 11/07/2021. The right column shows the highest number of COVID-19 patients hospitalized during the same time period.
